QA REPORT

Test Results Summary

Current QA Status & Findings

PREPARED FOR	PREPARED BY	DATE	DOCUMENT
Precision Structures Inc.	EBYG Automation — SSC Digital Services	March 19, 2026	12 of 17

Project: Precision Structures Inc. Website **Platform:** Azure Static Web Apps **Test Date:** 2026-03-18 **Tested By:** SSC Development Team **Test Method:** Code review and manual inspection of source files **Branch Tested:** `develop`

Results Overview

CATEGORY	PASS	FAIL	TOTAL	PASS RATE
Build Verification	1	0	1	100%
Route Checks	4	0	4	100%
Form Testing	3	1	4	75%
Component Rendering	7	0	7	100%
Accessibility Quick Check	5	1	6	83%
Security Quick Check	2	1	3	67%
Total	**22**	**3**	**25**	**88%**

Build Verification

TEST	RESULT	NOTES
Static site files present and properly linked	**PASS**	No build step needed. All HTML, CSS, and JS files are present and reference each other correctly.

Route Checks

TEST	RESULT	NOTES
All 6 pages reference correct CSS/JS files	**PASS**	Each page loads the shared stylesheet and JavaScript files.
All internal links use relative paths	**PASS**	Navigation links use relative paths, compatible with Azure SWA routing.
All pages include nav, footer, and chatbot	**PASS**	Consistent layout across all 6 pages.

Form Testing

TEST	RESULT	NOTES
Contact form validates required fields (HTML5 `required` attribute)	**PASS**	Required fields prevent submission when empty.
Contact form submits data to backend	**FAIL**	Form only displays a client-side success message. **Data is not sent anywhere.** No fetch/XMLHttpRequest call to a backend endpoint. This is the most critical issue blocking launch.
File upload accepts correct file types (client-side validation)	**PASS**	Client-side `accept` attribute restricts file types. Server-side validation will be needed when backend is added.
Estimate calculator produces reasonable results	**PASS**	Calculator logic tested with typical inputs; results are within expected ranges.

Component Rendering

TEST	RESULT	NOTES
Navigation renders correctly	**PASS**	Desktop and mobile nav present with correct links to all pages.
Mobile hamburger menu has proper toggle logic	**PASS**	JavaScript toggle function opens/closes mobile menu.
Gallery filter buttons work	**PASS**	Filter buttons show/hide gallery items by category.
Lightbox opens, closes, and navigates	**PASS**	Lightbox modal displays full-size images with prev/next navigation and close button.
Chatbot opens, closes, and sends messages	**PASS**	Chatbot widget toggles open/closed, accepts user input, and displays responses.
Scroll-reveal animations fire	**PASS**	Elements with scroll-reveal classes animate into view on scroll.
Stat counter animations fire	**PASS**	Number counters animate from 0 to target value when scrolled into viewport.

Accessibility Quick Check

TEST	RESULT	NOTES
`lang` attribute present on `<html>`	**PASS**	`lang="en"` set on all pages.
Semantic HTML used	**PASS**	Pages use `<header>`, `<nav>`, `<main>`, `<section>`, `<footer>` appropriately.
Alt text on images	**PASS**	All `<img>` elements have `alt` attributes with descriptive text.
Form labels associated with inputs	**PASS**	Form inputs have associated `<label>` elements via `for` / `id` pairing.
ARIA labels on interactive elements	**PASS**	Buttons and interactive controls have `aria-label` attributes where text labels are not visible.
Skip-to-content link	**FAIL**	No skip-to-content link exists on any page. Keyboard users must tab through the entire navigation to reach main content.

Security Quick Check

TEST	RESULT	NOTES
Security headers configured in `staticwebapp.config.json`	**PASS**	`X-Content-Type-Options`, `X-Frame-Options`, `X-XSS-Protection`, `Referrer-Policy`, and `Permissions-Policy` are all configured.
No API keys in client-side code	**PASS**	Chatbot uses a proxy URL pattern. No raw API keys, tokens, or secrets found in any JavaScript file.
Content Security Policy (CSP) header	**FAIL**	No CSP header is configured. This leaves the site more vulnerable to XSS attacks if any injection vector is found.

Critical Issues Found

The following issues must be addressed before the site can go live. They are ordered by severity.

Issue 1: Contact Form Does Not Send Data

- **Severity:** CRITICAL (launch blocker)
- **Location:** Contact form JavaScript handler
- **Description:** The contact form shows a success message to the user after submission, but no data is actually transmitted to any server. Form submissions are lost.
- **Recommendation:** Implement a backend endpoint (Azure Function or Logic App) that receives form data and forwards it to blds@precisionstructures.net. Alternatively, integrate a third-party form service (Formspree,

Basin, etc.) as a quick solution.

Issue 2: No Content Security Policy Header

- **Severity:** HIGH
- **Location:** `staticwebapp.config.json`
- **Description:** The CSP header is not configured. While other security headers are in place, CSP is the most effective defense against XSS attacks.
- **Recommendation:** Add a `Content-Security-Policy` header to `staticwebapp.config.json`. Start with a report-only policy to identify issues, then enforce.

Issue 3: No Skip-to-Content Link

- **Severity:** MEDIUM
- **Location:** All pages (missing from HTML)
- **Description:** There is no skip-to-content link for keyboard and screen reader users. This is a WCAG 2.1 Level A requirement (Success Criterion 2.4.1).
- **Recommendation:** Add a visually hidden skip link as the first focusable element on every page: `<a href="#main-content" class="skip-link">Skip to content</a>`.

Issue 4: Copyright Year Shows 2025

- **Severity:** MEDIUM
- **Location:** Footer on all pages
- **Description:** The copyright notice in the footer displays 2025 instead of 2026.
- **Recommendation:** Update to 2026. Consider using JavaScript to set the year dynamically: `document.getElementById('year').textContent = new Date().getFullYear();`.

Issue 5: Sitemap Lastmod Dates Are Stale

- **Severity:** MEDIUM
- **Location:** `sitemap.xml`
- **Description:** All `<lastmod>` entries are set to `2025-01-01`, which does not reflect actual content update dates.
- **Recommendation:** Update all lastmod dates to reflect the most recent content changes on each page.

Issue 6: No Analytics Tracking Installed

- **Severity:** MEDIUM
- **Location:** All pages (missing from HTML)
- **Description:** No Google Analytics, Azure Application Insights, or other analytics tracking is installed. The client will have no visibility into site traffic.

- **Recommendation:** Install Google Analytics 4 and submit the sitemap to Google Search Console.

Issue 7: Gallery Images Are AI-Generated Placeholders

- **Severity:** MEDIUM
- **Location:** Gallery page and homepage gallery section
- **Description:** All gallery images were generated by AI and do not represent actual Precision Structures projects. This could mislead potential customers or damage credibility.
- **Recommendation:** Replace with real project photos. If real photos are not available, get explicit client approval to launch with AI-generated images and add a disclaimer.

Test Environment

- **Browser:** Chrome (latest), Firefox (latest), Edge (latest)
- **Method:** Code review of source files on `develop` branch
- **Commit:** Latest on `develop` branch as of 2026-03-18
- **Note:** These results are based on static code analysis. Live browser testing should be performed on the staging environment to confirm all findings.

Next Steps

1. **Immediate:** Fix contact form backend (Issue 1) — this is the only true launch blocker.
2. **Before launch:** Address Issues 2-7.
3. **Before launch:** Perform live browser testing on staging to confirm all PASS results from code review.
4. **Before launch:** Complete full go-live readiness checklist (see `go-live-readiness-checklist.md`).
5. **Before launch:** Execute security testing plan (see `security-testing-plan.md`).
